Making a home - how to get as much natural light into your home as possible

Firstly, let me wish you all a very Happy New Year and I hope you had a lovely festive break. 2012 is set to be an exciting year for us, as well as the country as a whole. We have the Queen's Diamond Jubilee and the Olympics to look forward to, where the spotlight will be on our wonderful capital city and the surrounding Home Counties and inevitably the area will generate interest from visitors looking to move into these desirable locations.

Many developers use external contractors to build their homes; however we are proud to say we have our own construction company, Neatstone, who have been in the industry for over 30 years, to build our homes ensuring we retain our enviable reputation for quality. We currently have a team of about seven on site, directed by our site manager

Richard and together they are busy working towards the first floor level and installing the structural steel works and roof timbers. The skills set involved at this particular stage are engineering, bricklaying, carpentry and laboring each with significant roles to play. The roof structure in particular is one area that I, as a chartered structural engineer, have considerable involvement with. As anyone who has visited one of our homes knows we design as much glazing into the roof style as structurally and practically as possible, our aim is to get as much natural light into the core of the house.

We are renowned for our expertise and proud of our extensive knowledge and experience within the housing industry, so with Hitchambury Homes you can rest assured in the knowledge that you are not only buying a great product, you are also

making a good investment!

Join me next month for more information on our exciting new development, but until then, here's to a prosperous 2012 and beyond
